Work Experience

Nov 2023 - Dec 2024   *HONG LIM COMPLEX SINGAPORE (051531)*

Frontend Web Developer

SportsNerve Solutions Pte Ltd

As a frontend developer at SportsNerve Solutions, a Singapore-based company, I develop and maintain the website's frontend using React.js and React Redux, ensuring a seamless user experience. Working remotely full-time, I collaborate with teams to implement responsive designs, optimize performance, and maintain high code standards. I stay updated with industry trends to deliver innovative, user-focused solutions.

Projects

396 Days

Sport app

I had the privilege of working as a frontend developer for SportsNerve, a Singapore-based company, while remotely supporting their operations from India. During my tenure, I played a pivotal role in

delivering high-quality web solutions using advanced frontend technologies like React.js and React Redux. My contributions included seamless API integrations, implementing modern libraries such as Image Cropper for editing, Toastify for notifications, and Modals for enhanced user interfaces. I also worked with tools like Axios for efficient API handling, Google Maps API for geolocation features, and Moment-Timezone to manage global time zones effectively. Additionally, I leveraged React-ID-Swiper for interactive carousels and Socket.io-client for real-time updates. Passionate about utilizing technology to drive business success, I am always eager to connect and collaborate on impactful, innovative projects.

2 Months

Niotek

I successfully developed a full-stack website for a contract-based project, handling both the frontend and backend, along with an admin panel for managing all functionalities and content. The frontend was built using React.js, Redux, Bootstrap, Axios, and React-Toastify for notifications, ensuring a responsive and user-friendly interface. On the backend, I utilized Node.js, Express.js, MongoDB, and Mongoose to create a robust and scalable server architecture. Security and functionality were enhanced with tools like JSON Web Tokens for authentication, Multer for file uploads, and AWS S3 for secure media storage. The admin panel featured content sanitization using sanitize-html and automated email notifications powered by Nodemailer. This comprehensive tech stack enabled efficient content management and a seamless user experience.

1 Months

CBT website

I had the opportunity to work on a contract-based project for the CBT brand's website, where I developed a dynamic and visually engaging frontend. The tech stack included React.js for building a responsive and interactive interface, Tailwind CSS for efficient and modern styling, and Animate.css for adding smooth transitions. I also utilized Framer Motion and GSAP for advanced animations, ensuring a captivating user experience, along with FullPage.js for seamless full-screen scrolling. This project allowed me to create an immersive and high-quality web presence tailored to the brand's vision.
